0x00:热身题

渗透测试大法: 第一招, 扫端口; 第二招, ...。

扫后台试试呗, 用御剑扫到存在robots.txt, 访问发现很多个Disallow:可能的试试, 发现flag在/rob0t.php中

flag:GCTF{ae609880185f1d75}

0x01:reverseMe

下载下来的文件用winhex查看一下发现头部D9FF很眼熟啊, 想起来和JPEG文件格式的尾部FFD9正好反过来而且题目是reverseMe, 赶紧去看看尾部D8FF正好是JPEG文件头倒过来, 那么就明显了就是让我们把文件数据反过来, 这里在windows下的python中总是读不全该文件, 扔到linux中去执行就ok了, 改成jpg后缀查看是个倒着的flag直接反着输入即可。

#python脚本

```
a=open("ae0c42b1-5e0d-4600-abc8-40f36a763061.reverseMe")
temp=a.read()
temp=temp[::-1]
b=open("1.jpg",'w+')
b.write(temp)
```

{e0d07e40f0c5a706d0c0b1f0d7c8e784277A} gslf

0x02:text.pyc

文件下载下来后是个pyc文件去在线pyc反编译: <https://tool.lu/pyc/>, 发现有部分不能编译, 又找到了NSCTF的re500和这题很类似: http://blog.nsfocus.net/wp-content/uploads/2015/09/reverse_500.pdf, 去用uncompyle反编译找到报错的位置, 这里专门去研究了一下pyc的字节码, 开始报错的位置是3个NOP也就是对应字节码09, 然后发现有三个LOAD_CONST并没有用到, 猜测应该是把这几个字符串都相加起来, 也就是修改成为头两个LOAD_CONST然后BINARY_ADD,再一个LOAD_CONST再BINARY_ADD的形式:

```
00 02 00 00 00 40 00 00 00 73 48 00 00 00 64 0D |
00 64 03 00 17 64 04 00 17 64 05 00 17 64 06 00 |
17 5A 00 00 64 07 00 64 08 00 6C 01 00 5A 01 00 |
```

即64 0D 00 64 03 00 17 64 04 00 17 64 05 00 17 64 06 00 17

再把改了后的pyc拿去反编译可以看到前面的str变成了5个字符串相加, 后面出错的地方为flag3的函数位置有4个00字节码, 比较前面两个函数的字节码发现这四个字节码是多余的, 于是删除了这四个00, 但是发现删除后并不能运行, 最后自己慢慢的研究了下字节码发现flag3函数的字节码和前两个函数基本相同, 不同的就是多了个base64的解码, 于是还原原py文件再运行flag3()拿到flag:

#python代码

```
str = 'cWbihGfyMzNllzZ' + '0cjZzMW'+ 'N5cTM4Y'+ 'jYygTOy' + 'cmNycWNYymM1Ujf'
```

```
import base64
```

```
def flag1():
```

```
code = str[::-3]
```

```
result = ""
```

```
for i in code:
```

```
ss = ord(i) - 1
```

```
result += chr(ss)
```

```
print result[::-1]
```

```
def flag2():
```

```
code = str[::-2]
```

```
result = ""
```

```
for i in code:
```

```
ss = ord(i) - 1
```

```
result += chr(ss)
```

```
print result[::-2]
```

```
def flag3():
```

```
code = str[::-1]
```

```
code = base64.b64decode(code)
```

```
result = ""
```

```
for i in code:
```

```
ss = ord(i) - 1
```

```
result += chr(ss)
```

```
print result[::-1]
```

```
flag3()
```

执行结果:

flag{126d8f36e2b486075a1781f51f41e144}结束后了解到删除那四个字节后还要改前面的总字节数

0x03: APK逆向

下载后dex2jar然后jd-gui去看代码，思路还是比较清晰的大体就是把字符串Tenshine，getbytes的md5值去执行tohexstring函数得出一个字符串和你输入的字符串比较，直接把两个函数拿出来写个java执行就行了：

```

import java.security.MessageDigest;
import java.security.NoSuchAlgorithmException;
public class one {
public static void main(String[] args) {
try{
String str="Tenshine";
MessageDigest localMessageDigest = MessageDigest.getInstance("MD5");
localMessageDigest.reset();
localMessageDigest.update(str.getBytes());
String str1 = toHexString(localMessageDigest.digest(), "");
StringBuilder localStringBuilder = new StringBuilder();
for (int i = 0; i < str1.length(); i += 2)
localStringBuilder.append(str1.charAt(i));
String str2 = localStringBuilder.toString();
System.out.println(str2);
}
catch (NoSuchAlgorithmException localNoSuchAlgorithmException)
{
localNoSuchAlgorithmException.printStackTrace();
}
}

private static String toHexString(byte[] paramArrayOfByte, String paramString)
{
StringBuilder localStringBuilder = new StringBuilder();
int i = paramArrayOfByte.length;
for (int j = 0; j < i; j++)
{
String str = Integer.toHexString(0xFF & paramArrayOfByte[j]);
if (str.length() == 1)
localStringBuilder.append('0');
localStringBuilder.append(str).append(paramString);
}
return localStringBuilder.toString();
}
}

```

0x04:debug.exe

用peid查看发现是.net程序，用ILSPY去查看程序，查到关键类，同样直接把函数拿出来写个C#即可：

```
private static int a(int A_0, int A_1)
```

```
{  
return (new int[]  
{  
2,  
3,  
5,  
7,  
11,  
13,  
17,  
19,  
23,  
29,  
31,  
37,  
41,  
43,  
47,  
53,  
59,  
61,  
67,  
71,  
73,  
79,  
83,  
89,  
97,  
101,  
103,  
107,  
109,  
113  
})[A_1] ^ A_0;  
}
```

```
private static string b(string A_0)
```

```
{  
byte[] bytes = Encoding.ASCII.GetBytes(A_0);  
return "flag{" + BitConverter.ToString(new MD5CryptoServiceProvider().ComputeHash(bytes)).Replace("-", "")  
+ "}";  
}
```

```

private static void c(string A_0, int A_1, ref string A_2)
{
int num = 0;
if (0 < A_0.Length)
{
do
{
char c = A_0[num];
int num2 = 1;
do
{
c = Convert.ToChar(a(Convert.ToInt32(c), num2));
num2++;
}
while (num2 < 15);
A_2 += c;
num++;
}
while (num < A_0.Length);
}
A_2 = b(A_2);
}

```

```

private void button1_Click(object sender, EventArgs e)
{
string str = null;
string value = string.Format("{0}", DateTime.Now.Hour + 1);
string a_ = "CreateByTenshine";
c(a_, Convert.ToInt32(value), ref str);
textBox1.Text = str;
}
}

```

把CreateByTenshine和当前小时+1去做函数c返回的str即为flag，这里好像发现最后答案不管在几点都一定。

flag{967DDDFBCD32C1F53527C221D9E40A0B}
